

TASK 2

Python conditional statements:

1. Write a program that takes an integer as input and prints "Positive" if it's positive, "Negative" if it's negative, and "Zero" if it's zero.
2. Write a program that takes a number as input and prints "Even" if it's even, "Odd" if it's odd.
3. Write a program that takes a string as input and checks if it's a palindrome (i.e., the same forwards and backwards).
Print "Palindrome" if it is and "Not Palindrome" otherwise.
4. Write a program that takes three integers as input and prints the largest one.
5. Write a program that takes two integers as input and prints "Equal" if they are equal, "Not Equal" otherwise.
6. Write a program that takes a string as input and checks if it contains only alphabets (no numbers or special characters).
Print "Only Alphabets" if it does and "Not Only Alphabets" otherwise.
7. Write a program that takes an integer as input and prints "Leap Year" if it's a leap year (divisible by 4 and not divisible by 100 or divisible by 400), and "Not Leap Year" otherwise.

Python Data Types:

1. Write a Python program to create a list of student names to find the number of students in the list. Then, print the count.

- Sample Input:

- `students = ["Alice", "Bob", "Charlie", "David", "Eve"]`

- Expected Output:

- 5

2. Write a Python program to create a tuple of numbers to check if a specific number is present in the tuple. Print "Found" if the number is present, otherwise print "Not Found".

- Sample Input:

- `numbers = (1, 2, 3, 4, 5)`

- Expected Output:

- "Found" (if searching for 3),

- "Not Found" (if searching for 6)
